

Maestro

INTEGRATED CCTV CONTROL

MAESTRO SOFTWARE OPTION

DESCRIPTION

Cansec's Integrated CCTV option allows Maestro to operate with American Dynamics, Panasonic, Pelco (AD Translator required), and the Cansec MiniSwitch matrix switchers to control both fixed and Pan/Tilt/Zoom cameras and monitors connected to the video switcher for alarm processing.

All cameras connected to the switcher are defined in Maestro as either fixed or Pan/Tilt/Zoom. If the switcher supports camera tours or sequences, tour numbers can be assigned to the monitors so that after an alarm is processed, the switcher's tour can be resumed.

Each reader or point in Maestro is assigned a camera for alarm display. When alarms occur and are selected for processing, a CCTV Toolbar is provided to control the camera(s) and monitor(s) connected to the switcher. With one click of the mouse, the associated camera image will be displayed on the monitor selected. While in the Alarm Processing window, the operator may control Pan/Tilt/Zoom as well as Focus and Iris adjustments. After alarm processing is complete, control of the monitor is given back to the switcher with a single click of a button on the toolbar.

TYPICAL CONFIGURATION
