ALARM ACTIVATED PAGER INTERFACE

MAESTRO SOFTWARE OPTION

DESCRIPTION

Cansec's Alarm Activated Pager interface provides the ability to receive alarm messages from a host PC running Maestro Integrated Security Management Software. This powerful feature allows the user to define Paging Profiles which define "at which times" and "to what pager" the alarm message is to be transmitted. Once profiles are created, they can be easily and quickly applied to any device in the system. Messages are displayed with the date, time and description of the alarm. An added feature is the ability to manually send text messages to any pager defined in the system.

The following are required for this feature:

1. A dedicated communications port and modem connected to the host PC.
2. A paging service using the Telocator Alphanumeric input Protocol (TAP).
3. An alphanumeric pager supporting the TAP protocol.

TYPICAL CONFIGURATION
